Chapter 11: Parametric and Polar Curves

Illya Starikov

June 30, 2025

Contents

11.1 Parametric Equations

Forward or Positive Orientation

The direction in which a parametric curve is generated as the parameter increases is called the **forward**, or **positive**, **orientation** of the curve.

Derivative for Parametric Curves

Let $x = g(t)$ and $y = h(t)$, where g and h are differentiable on an interval $[a, b]$. Then

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{y'(t)}{x'(t)} \tag{1}$$

provided $\frac{dx}{dt} \neq 0$.

11.2   Polar Coordinates

Introduction

- Up to now we have only studied in a Cartesian coordinate system.

    - A Cartesian coordinate system is just a plane described by Cartesian (or, algebraic) equations and points in a finite dimensions.
        * *One Dimension*: Lines.
        * *Two Dimensions*: x^2.
        * *Three, Four*: Upper-level Calculus and Physics.

- Let's define an alternative coordinate system — **polar coordinate.**

    - coordinates are constants on circles and rays.

    - Useful for navigation, position, and gravitation fields.

Defining Polar Coordinates

Pole The origin of the coordinate system.

Polar Axis Synonymous for the positive x-axis.

**Polar Coordinates** A polar coordinates P has the form (r, θ).

    Radial Coordinate The radial coordinate r describes the *signed*, or *directed*, distance from the origin to P.

    Angular Coordinate The angular coordinate θ describes an angle whose initial side is the positive x-axis and whose terminal side lies on the ray passing through the origin and P.

Notes

- **Positive angle measurements are measured *counterclockwise* from the origin.**

- Every point has multiple representations.

    - Angles are periodic, so multiples of 2π gives the same angle.

– Coordinates may be negative. So (r, θ) can be represented as $(-r, \theta + \pi)$ and $(-r, \theta - \pi)$
y-axis

$P(r, \theta), r > 0$

θ

x-axis

In summary,

- $(r, \theta + 2\pi)$ represents the same point as (r, θ)

- $P(r, \theta)$ and $P'(-r, \theta)$ are reflections through the origin.
Examples

Graph the following points in polar coordinates:

- $Q(1, \frac{5\pi}{3})$

- $R(-2, \frac{3\pi}{2})$

- $S(3, -\frac{9\pi}{4})$

  – Now give two alternative representations.
  – $S'(3, \frac{1\pi}{4})$
  – $S''(-3, -\frac{5\pi}{4})$

Converting Between Cartesian and Polar Coordinates

- We sometimes need to convert between Cartesian and polar coordinates.

- Let's turn this problem into a right triangle.

A point with polar coordinates (r, θ) has Cartesian coordinates (x, y), where

$$x = r \cos \theta \quad \text{and} \quad y = r \sin \theta \tag{2}$$

A point with Cartesian coordinates (x, y) has polar coordinates (r, θ), where

$$r^2 = x^2 + y^2 \quad \text{and} \quad \tan \theta = \frac{y}{x} \tag{3}$$

Examples

BE SURE TO GRAPH POINTS IN CARTESIAN FIRST.

Polar to Cartesian

Express the point with the following polar coordinates in Cartesian coordinates: $P(3, \frac{2\pi}{3})$

$$
\begin{aligned}
x &= r \cos \theta & y &= r \sin \theta \\
&= 3 \cos(2\pi/3) & &= 3 \sin(2\pi/3) \\
&= -3(1/2) & &= 3(\sqrt{3}/2) \\
&= -3/2 & &= 3\sqrt{3}/2
\end{aligned}
$$

Polar to Cartesian

Express the point with the following polar coordinates in Cartesian coordinates: $Q(e, -\frac{\pi}{4})$

$$
\begin{aligned}
x &= r \cos \theta & y &= r \sin \theta \\
&= e \cos(-\pi/4) & &= e \sin(-\pi/4) \\
&= e(\sqrt{2}/2) & &= -e(\sqrt{2}/2) \\
&= e\sqrt{2}/2 & &= -e\sqrt{2}/2
\end{aligned}
$$

7

Cartesian To Polar

Express the point with the following Polar coordinates to Cartesian coordinates: $R(1, -1)$

$$r = \sqrt{x^2 + y^2}$$
$$= \sqrt{1^2 + (-1)^2}$$
$$= \sqrt{2}$$

$$\tan\theta = y/x$$
$$= {-1}/1$$
$$= -1$$
$$\theta = {-\pi}/4 \text{ or } {7\pi}/4.$$

Therefore, two possible solutions are: $(\sqrt{2}, {-\pi}/4)$ or $(\sqrt{2}, {7\pi}/4)$

Cartesian To Polar

Express the point with the following Polar coordinates to Cartesian coordinates: $S(1, \sqrt{3})$

$$r = \sqrt{x^2 + y^2}$$
$$= \sqrt{(\sqrt{3})^2 + (1)^2}$$
$$= 2$$

$$\tan\theta = y/x$$
$$= \sqrt{(3)}/1$$
$$\theta = \pi/3 \text{ or } {4\pi}/3.$$

Therefore, two possible solutions are: $(2, \pi/3)$ or $(2, {4\pi}/3)$.

Basic Curves in Polar Coordinates

- A curve in polar coordinates is the set of **points** that satisfy an equation in r and θ.

- This makes graphing some things easier than others.

- Look at $r = 3$ is the set of all points that satisfy being away from the origin of 3 units.

    - This is because θ is not specified, it's arbitrary. Basically, θ is the function.

- In general, $r = a$, $\forall a \in \mathbb{R}^+$ describes a circle.

- Taking the converse, let r be arbitrary.

  - If the r is arbitrary, and we specify the angle, what do you think we get?
  - A line!
  - Take $\sqrt{2}/2$.

Polar to Cartesian Graph Example

Convert the polar equation $r = 6 \sin \theta$ to Cartesian coordinates and describe the corresponding graph.

$$
\begin{align}
r^2 &= 6r \sin \theta \tag{4} \\
x^2 + y^2 &= 6y \tag{5} \\
0 &= x^2 + y^2 - 6y \tag{6} \\
&= x^2 + (y^2 - 6y + 9) - 9 \tag{7} \\
&= x^2 + (y - 3)^2 - 9 \tag{8}
\end{align}
$$

We recognize this to be the equation of a circle, centered at $(0, 3)$ at 3. We can also generalize this.
Circle in Polar Coordinates

- The equation $r = a$ describes a circle of radius $|a|$ centered at $(0,0)$.

- The equation $r = 2a \sin \theta$ describes a circle of radius $|a|$ centered at $(0, a)$.

- The equation $r = 2a \cos \theta$ describes a circle of radius $|a|$ centered at $(a, 0)$.

9
Graphing In Polar Coordinates

Graph the polar equation $r = f(\theta) = 1 + \sin\theta$

θ	$r = 1 + sin\theta$
0	1
$\pi/6$	$3/2$
$\pi/2$	2
$5\pi/6$	$3/2$
π	1
$7\pi/6$	$1/2$
$3\pi/2$	0
$11\pi/6$	$1/2$
2π	1

The resulting curve is known as a **cardioid**.

Cartesian-to-Polar Method for Graphing $r = f(\theta)$

1. Graph $r = f(\theta)$ *as if r and θ were Cartesian coordinates* with θ on the horizontal axis and r on the vertical axis. Be sure to choose an interval in θ on which the entire polar curve is produced.

2. Use the Cartesian graph in Step 1 as a guide to sketch the points (r, θ) on the final *polar* curve.

Example
With the alternate graphing method, graph $r = 1 + \sin\theta$.

r and θ as Cartesian coordinates

r and θ as polar coordinates

FIGURE 11.26

Symmetry In Polar Equations

Symmetry about the x-axis occurs if the point (r, θ) is on the graph whenever $(r, -\theta)$ is on the graph.

Symmetry about the y-axis occurs if the point (r, θ) is on the graph whenever $(r, \pi - \theta) = (-r, -\theta)$ is on the graph.

Symmetry about the origin occurs if the point $(r, \theta$ is on the graph whenever $(-r, \theta) = (r, \theta + \pi)$ is on the graph.

11

11.3   Calculus in Polar Coordinates

Slope of a Tangent Line

Let f be a differentiable function at θ_0. The slope of the line tangent to the curve $r = f(\theta)$ at the point $(f(\theta_0, \theta_0)$ is

$$\frac{dy}{dx} = \frac{f'(\theta_0)\sin\theta_0 + f(\theta_0)\cos\theta_0}{f'(\theta_0)\cos\theta_0 - f(\theta_0)} \tag{9}$$

Area of Regions in Polar Coordinates

Let R be the region bounded by the graphs of $r = f(\theta)$ and $r = g(\theta)$, between $\theta = \alpha$ and $\theta = \beta$, where f and g are continous and $f(\theta) \geq g(\theta) \geq 0$ on $[\alpha, \beta]$. The area of R is

$$\int_{\alpha}^{\beta} \frac{1}{2}(f(\theta)^2 - g(\theta)^2)\, d\theta \tag{10}$$
